

# THE TRUTH ABOUT DATA LOSS

## Simple-Safe-Secure *Internet Backup from Someone You Trust*

### What are the top ways that data loss occurs?

1. **Human Error** – accidental or unknowing data deletion, modification, and overwrite. With AZXnetworks-eVault Backup Manager, be confident that if any of these should occur, you can recover the original document, and also recover any prior saved version of the document.
2. **File Corruption** – software error, virus infection. Can you always control if software is going to go bad, or if you will suffer a virus infection? You can control how much impact an event such as this will affect your business.
3. **Hardware** – drive failure, controller failure, CPU failure. Does your hard drive warn you before it crashes, taking all your precious data with it? Offsite data storage will guarantee that even if you lose an entire system, getting back data is not a problem.
4. **Site-related** – theft, fire, flood, earthquake, lightning, etc. Did you purchase insurance for any of the above instances on your office and its contents? You can rebuild and refurbish an office, how would you restore your lost data?
5. **Theft** – office equipment, or worse, laptop theft. Someone breaks into your office and steals even a couple of computers? An employee is at the airport and their laptop is stolen. How would you get back all of that precious data?

### Data loss can happen to anyone

Don't allow yourself or your business to be caught in an emergency with no way of recovering the data that is so precious to you. AZXnetworks-eVault Backup Manager is an off-site data backup program, there is no hardware to fail or to maintain, and data is copied to multiple secure sites to ensure the utmost safety of your information.
